

Window:

4.

Utterances:

O: appears to be a sustained vowel with little variation in the main MFCC coefficients; they gradually decay over time.

LMFCCs for digit 'o'

z: voiced fricative, showing noisy, irregular MFCC patterns (fricative → noise, generated by letting air through thin channel), with some underlying structure due to voicing (unlike s, z is voiced → not “only” noise)

LMFCCs for digit 'z'

1: shows around three distinct acoustic segments, with the strongest energy in the middle portion. (uAn)

2: brief initial burst followed by a stable vowel region with smooth MFCC coefficients, slowly increase

3: noisy fricative onset transitioning into a more stable vowel pattern

LMFCCs for digit '3'

4: the initial segment (likely /f/) has low energy in lower coefficients, consistent with a fricative sound.

LMFCCs for digit '4'

5: clear three-part structure with fricative onset, changing diphthong (“ai”, coefficients change slowly), and voiced ending

LMFCCs for digit '5'

6: multiple rapid transitions with fricative segments and a short, less stable vowel

S i k s

LMFCCs for digit '6'

7: exhibits 4–5 distinct acoustic segments, indicating multiple phoneme transitions.

LMFCCs for digit '7'

8: mostly stable vowel/diphthong region with a short final consonant

LMFCCs for digit '8'

9: smooth nasal, diphthong (ai), nasal patern → gradual MFCC transitions

LMFCCs for digit '9'
